Problem – Solution weather wise

The AI Weather Wise API is designed to provide weather-related information through an API-based solution. Users and applications may need weather information in a simple and accessible form for planning daily activities and making weather-aware decisions. The proposed solution focuses on providing weather data through an easy-to-use API, helping applications access and use weather information efficiently.

Problem

Accessing weather information can be inconvenient when users or applications have to depend on different sources or interfaces. A solution is needed that can make weather information easier to access and integrate into applications.

Proposed Solution

AI Weather Wise API provides an API-based way to access weather information It can act as a common interface between weather data and applications, allowing users or developers to request weather information and receive it in a usable format.

Target Users

- Students and project developers who need weather information in applications.
- Developers who want to integrate weather data through an API.
- Users who need accessible weather information for daily planning.
- Applications that require weather-related data.

Problem–Solution Weather wise

The problem is the difficulty of accessing and integrating weather information in a simple and consistent way. The AI Weather Wise API addresses this problem by providing a structured API interface through which weather information can be requested and used by applications. This creates a direct connection between the user's requirement for weather information and the proposed API solution.

Purpose

- ❑ Solve the problem of accessing weather information in a convenient way.

- Provide a simple API interface for applications that require weather data.
- Make weather information easier to integrate into software projects.
- Understand the needs of the target users and provide a solution that fits those needs.

Expected Value

The proposed API can reduce the effort requiredto obtain and use weatherinformation withinapplications.By providingweatherdata throughan API interface,it can supporteasier integration and improve accessibility for users and developers.
