Project Design Phase

Proposed Solution Template – AI Weather Wise API

S.No. / Parameter	Description
1. Problem Statement (Problem to be solved)	Users need clear and easily understandable weather information for planning their dail activities. Raw weather data can be difficult to interpret, especially when users need quick information about temperature, rainf humidity, wind and other weather conditio The proposed AI Weather Wise API aims to provide weather information in a simple an user-friendly way.
2. Idea / Solution description	AI Weather Wise API is a weather-based application programming interface that provides weather information for a selected location. It can collect weather data through an API and present the information in an understandable format. The solution is designed to help users quickly access weather conditions and make better day-to-day plans based on the available weather information.
3. Novelty / Uniqueness	The solution focuses on presenting weather information in a simple, organized and user friendly manner. Instead of requiring users understand complex weather data, the API can provide important weather details in ar easy-to-read format. The AI-oriented approach can also support intelligent interpretation of weather information and provide useful, context-based information t users.
4. Social Impact / Customer Satisfaction	The solution can help students, workers, travellers, farmers, delivery personnel and other users who depend on weather information for daily activities. Easy access

5. Business Model (Revenue Model)	to understandable weather information can help users plan travel, outdoor activities and other weather-dependent tasks. A simple interface and relevant information can improve user experience and satisfaction.
6. Scalability of the Solution	The AI Weather Wise API can be scaled to support more users, locations and applications. It can be integrated with websites, mobile applications and other software systems. Additional features such as extended forecasts, alerts, location-based services and intelligent weather insights can be added as the project grows. Cloud-based deployment and API-based architecture can support future expansion.
